SQL query

create table,insertion,update,alter

waqtd ename whose salary is more than avreage(sal) in department

https://www.programiz.com/sql/online.compiler/ (asked from this website)

single row function,different types of databases

joints and subqueries

how to merge two tables

sql statements and their syntax and some basics queries

how to get unique records without using distinct keyword

some question on pseudo columns

round function in single row function

DDL statements

syntax to rename column

what is roolback

QUERIES on GROUP BY

use of HAVING clause in sql

SQL INNER JOIN

create table contains name ,id,insert one record

create table,foreign key,subquery,joins,ddl,dml,functions,update,tcl,view ,set operator,dcl,sql distinct

pseudo code questions

mcqs on join conditions

tell me the concepts you know in sql

waqtd salary in descending order

queries on inner join

in sql update and left join

write a query on insert statement

waqtd select employees whose salary is greater than 5000

join two tables employees and department using department number

tell me the concepts you know in sql

arrays

types of statement and explain with example

store procedure and cursor

functions,dcl,set operator

distinct

rename table name,update column name

delete first three records

waqtd sum of sal department wise

difference between dbms and rdms

what are constraints

what is self join

whats is normalization

waqtd maximum salary

difference between delete and truncate

difference between subquery aqnd correlated subquery and subquery

difference between inner join and outer join

waqtd highest salary from the table

what is trigger

difference between primary key and foreign key

query based on nested subqquery

why we need normalization

difference between having clause and where clause

difference between dcl and tcl

which sql statement is used to extract data from the database answer:select

waqtd to fetch three minimum salary from the above table

waqtd to print the details of the workers who are also manager

difference between left join and right join

waqtd to fetch first three characters from the given name

query to display the last record from the table

query to fetch second highest sal from emp table

first three letters in the ename column

queries on left join and right join

waqtd second max salary ,last input,uppercase,substring

waqtd names of employee who is getting salary greater thean average salary

waqtd to display names of employess whose name starts with S and ends with N

advance sql-stored procedure,triggers

sql creating schema and solving 3 questions and assigning primary key and foreign key

what are aggregate function

what is MAX in sql

difference between sql and mysql

add and contraints

write a query to convert text string of cheque date from table refund and add 15 years to get the maturity dat

waqtd to list the missign cheque No from table refund

waqtd sql query from table refund to get a report as shown in figure b

waqtd a sql query to show simple interest at 2% per month on payments from refund table

waqtd to get customer wise,flat wise,total mount from table refund

write a query to delete duplicate records from the table refund

write a query to generate a serial number like figure B from table refund

write a query to print only accounts dept employee

update the surname with name of the employee

index,unique vs primary key

truncate belong to which sql command

can you use the update and select clause in one sql statement

multirow functions ,join and its types

CRUD concepts

what is sql

difference between sql and nosql

what is database

how to fetch the emp name who belongs to hr department

how to find the count of employees present in hr department ? And tell what kind of join we use

how to insert the employee salary into the table which is going to be changed every year

Arra of string consist of name,dept_name,salary ["name,dept,sal","name,dept,sal"] a)count of each departme

what is normalization and its types

what is attribute

what is entity

what is cursor and writing

write a rules of EF cord

what is NVL

waaqtd no of employees getting a salary between 10000 and 20000 salary

difference between where clause and group by clause

substring and instring based queries

how to reduce redundancy is normalization
how to convert 1N form to second normal form

nt b)dept with coutn greater than 10 c)10 dept with highest salary
